

Speaker 5 of 5 — Data Analysis 2: Career Recommender

Career Compass SG · Module 1 Assignment · Group 7

Your time: up to 3 minutes · You close the presentation with the live demo

Your job in one sentence

Deliver the payoff. Your teammates showed the data and the map — you show the product that turns all of it into personal advice, and you make the ranking change **live, in front of the room**. The last thing the audience hears is yours.

Where you sit in the flow

	Speaker	Topic
	1	Dashboard overview
	2	Project technology stack
	3	Data cleaning
	4	Data analysis 1 — Demand vs Competition
→ YOU	5	Data analysis 2 — Career Recommender

Speaker 4 hands you: "...how do you turn a map into advice for one person? That's the Career Recommender." **You close the whole presentation.** Nobody follows you — end strong.

Before you start

- Dashboard already on the **Career Recommender** page
- Inputs pre-set: **3 years of experience, \$4,000 minimum salary**, all seniority levels
- Weight sliders at their defaults (30 / 30 / 25 / 15)
- Screenshot backup of the "before and after" rankings, in case the demo fails

Script

Part 1 — How the score works (0:00 – 0:50)

(Slide: the four components)

The Career Recommender scores every one of our 215 career tracks on **four things**:

- **Openings** — how many jobs exist in this track
- **Pay** — the median salary
- **Low competition** — few applicants per seat, from the reliable data window
- **Easy to enter** — what share of its jobs accept *your* years of experience

Here's the problem: these four come in different units — counts, dollars, ratios, percentages. You can't just add them up.

So we convert each one to a **rank from 0 to 100** across all tracks. Now they're on the same scale, and we combine them with **weights**. The default is roughly balanced. But — and this is the key idea — **the weights are sliders. The user controls them.** Because nobody but you knows whether money matters more than getting hired fast.

Part 2 — Live demo (0:50 – 2:10)

Let me be a real person. **I'm a career switcher: three years of experience, and I need at least \$4,000 a month.** *(point at the pre-set inputs)*

The tool says my best track is **Information Technology, mid level**. Around 69,000 postings, median pay \$6,500, about four applicants per seat — and **57% of those jobs accept my three years of experience**.

And look at these bars: they show **exactly why** it ranked first — how much each of the four parts contributed. Nothing is a black box. If you disagree with the advice, you can see precisely where it came from.

Now watch what happens when my priorities change. Suppose I don't want the best-paying career in five years — **I need a job in six weeks**.

(drag "Easy for me to enter" to maximum, drop "High pay" to minimum)

The entire top five changes. Now it's Human Resources, Sales, Education — at entry level. **Not a single track from the old list survives.** And that's correct! For someone who needs work quickly, those genuinely are the better answer.

The score is a set of sliders, not a verdict. Same data, different person, different advice — and every step of it visible.

Part 3 — Close (2:10 – 2:50)

(Slide: the closing line)

Let me close with the one sentence this whole project comes down to.

The best-paying career track and the easiest-to-enter career track are almost never the same track. Every job website makes you guess which one you're looking at.

Career Compass shows you both — and lets you decide which one you need this year.

Thank you. We're happy to take questions.

Numbers you must know cold

Figure	Value
Tracks scored	215 (minimum 200 postings each)
The four components	openings · pay · low competition · easy to enter
Default weights	30 / 30 / 25 / 15
Demo persona	3 years' experience, \$4,000 minimum
Top result (default)	IT – Mid: ~69,000 postings, \$6,500, ~4 applicants/seat, 57% open to 3 yrs
After slider change	HR / Sales / Education at Entry — zero overlap with the old top five

The before/after table — your backup if the demo fails:

Rank	Balanced (default)	"Easiest to enter"
1	Information Technology – Mid	Human Resources – Entry
2	Information Technology – Senior	Sales / Retail – Junior
3	Sales / Retail – Junior	Sales / Retail – Entry
4	Healthcare / Pharma – Mid	Education & Training – Entry
5	Sales / Retail – Entry	Events / Promotions – Entry

Questions you own

"Aren't the weights arbitrary? You could get any answer you want."

Exactly — and that's why they're sliders the user controls, not numbers we buried in the code. There is no objectively correct trade-off between money and speed of hiring. What we guarantee is that the four inputs are measured honestly, and every contribution is visible.

"Why ranks instead of raw numbers?"

Because you can't add dollars to a ratio. Ranks put everything on one 0-to-100 scale. The cost: the score is relative — "better than other tracks here", not "good in absolute terms".

"Why a minimum of 200 postings per track?"

Below that, the medians get too noisy to responsibly recommend anyone into. It's a judgement call, and it's written as a named constant in our config file.

"Does it know anything about me personally?"

Only your years of experience and your salary floor. It ranks market conditions — it doesn't know what you'd enjoy. We say that inside the app, in plain words.

If the live demo fails: switch to the before/after table above and read it out. **Never debug in front of the room.**

Rehearsal checklist

- ☐ Timed at **3:00 or under**, including the slider drag
- ☐ You have dragged those sliders on the presentation machine at least three times
- ☐ You can name the four components and the default weights from memory
- ☐ The closing two sentences delivered **without notes**
- ☐ Backup before/after table on your own slides
